Trixbox CE

Features

trixbox for the community

trixbox (spelt with a lowercase "t") began its life in 2004 as Asterisk@Home, that has quickly become the most popular Asterisk based distribution in the world. trixbox CE combines the best of Open Source telephony tools into one easy to install package, along with the customised trixbox dashboard which provides a web-based interface to configure and manage a complete IP-PBX system. trixbox CE has rapidly become the most flexible and customisable communications platform available, with an average of 65,000+ downloads per month.

Why use trixbox CE?

With the power of an enormous [community](#) driving the development and customisation of trixbox CE, the trixbox platform is the most customisable and modular IP Telephony systems available today. The trixbox community is, possibly the largest and most active with each member contributing to the development, troubleshooting, customisation and new projects, trixbox CE has all the benefits of the Open Source market, plus a commercial company standing behind it.

trixbox CE v2.2

Released in May 2007, trixbox CE 2.2 provides the trixbox community with increased reliability and many new features including a new point-and-click web-based graphical user interface (GUI) that increases the simplicity of deploying a new system, or maintaining an existing one. Furthermore, v2.2 provides an enhanced call data reporting module, a whole new network interface configuration tool, new status screen and improved endpoint manager that now supports Polycom, Linksys, Aastra, Cisco, Grandstream and Snom IP phone auto-deployment.

Features

- * unlimited extensions
- * TDM/SIP/IAX trunks
